1 Implemented Functionalities

We have implemented the following functionalities:

- Type inference for the underlying type system (including polymorphism, arrays, pairs and lists).
- Support confidentiality labels to the type system.
- Report errors for violations of constant time.
- Support mutable arrays, pairs, lists to the type system.
- (Bonus) Subtyping extension to subeffecting.
- (Bonus) Allow type annotation without labels.

The examples required by the assignment are attached in Section 3.

3 Examples

In this section, we provide code examples (including legal ones, which will be successfully compiled; and illegal ones, which will be reported as an error).

3.1 List

3.1.1 Pass

```
1 (1 : []) :: (List Nat^H)^H
1 let xs = (1 :: Nat^H) : 2 : [] in case xs of y : ys -> y, [] -> 1
```

3.1.2 Fail

```
1 let l = (1 : []) :: (List Nat^H)^H in case l of x : xs -> 1, [] -> 2
```

3.2 Array

3.3 Pass

```
1 let xs = (array 10 0 :: a0^H) in (xs, xs[0])
1 let xs = (array 10 0 :: a0^H) in xs[0] = xs[1]
1 let xs = (array 10 0 :: a0^H) in xs[0] = 1
```

3.3.1 Fail (violates constant time)

```
1 let len = 1 :: Nat^H in array len 0
1 let xs = (array 10 0 :: a0^H) in xs[0] / 3
1 let xs = (array 10 0 :: (Array Nat^L)^L) in xs[0] = (1 :: Nat^H)
```

3.4 Pair

3.4.1 Pass

```
1 (1, 2) :: (Nat^H, Nat^L)^H
1 let p = (1, 2) :: a0^H in case p of (x, y) -> x+1
```

3.4.2 Fail

```
1 let p = (1, 2) :: a0^H in case p of (x, y) -> x/3
1 let gx = (fn p -> case p of (x, y) -> x / 3) in gx ((1, 2) :: (Nat^H, Nat^H)^L)
```

3.5 Subeffecting & Subtyping

3.5.1 Subeffecting

```
1 let add = (fn x -> x + 1) :: (Nat^L -> Nat^H)^L in add 1
1 fn a -> if true then a else false :: Bool^H
1 fun f x -> if x < 1 then 0 :: Nat^H else 1 + f (x - 1)
```

3.5.2 Subtyping

```
1 (fn x -> fn y -> (x, y) :: a0^H) :: (Nat^b0 -> (Nat -> (Nat, Nat)^b0))
1 (3 :: Nat^b0) / 1
1 let p = (1, 2) :: a0^b0 in case p of (x, y) -> x/3
```
